

WHAT IT IS

Cryptocat is a free browser plugin that provides an **encrypted Instant Messaging environment** for your conversations. Different than Facebook Chat or Skype, Cryptocat is a secure and encrypted message environment to protect your privacy.

When you use most chat services, the messages you send go from you to a server to the person you're chatting with. Throughout this process, the messages remain **unencrypted**. This means that someone else who isn't in your conversation can potentially **intercept** it.

HOW NORMAL CHAT WORKS
